I hereby certify that this paper or fee is being deposited with the United States Postal Service "Express Mail Post Office to Addressee" service under 37 CFR 1.10 on the date indicated above and is addressed to the Assistant Commissioner for Patents, Washington, D.C. 20231.

Docket No.: GR 98 P 1397

MICHAEL BURNS

Date: September 20, 2000

Hon. Commissioner of Patents and Trademarks
Washington, D.C. 20231

Sir:

Enclosed herewith are the necessary papers for filing the following application for Letters Patent:

Applicant : ULRICH PRIESNITZ ET AL.

Title : LASER-MARKABLE SHEATHING

1 sheet of formal drawings in triplicate.

A check in the amount of \$690.00 covering the filing fee.

PCT Publication (cover sheet only).

This application is being filed without a signed oath or declaration under the provisions of 37 CFR 1.53(d). Applicants await notification of the date by which the oath or declaration and the surcharge are due, pursuant to this rule.

The Patent and Trademark Office is hereby given authority to charge Deposit Account No. 12-1099 of Lerner and Greenberg, P.A. for any fees due or deficiencies of payments made for any purpose during the pendency of the above-identified application.

Respectfully submitted,

For Applicants WERNER H. STEMER

LASER-MARKABLE SHEATHING

5 Cross-Reference to Related Application:

This is a continuation of copending International Application PCT/DE99/00818, filed March 19, 1999, which designated the United States.

10 Background of the Invention:

Field of the Invention:

The sheath of an electrical or optical communications cable is intended to protect the cable core, made up of stranding elements (optical waveguide strands, copper strands, dummy elements), the support and tension elements, and the wound wrapping that may be present, against mechanical, thermal and chemical influences as well as against moisture. In communications cables to be laid outdoors, the sheath usually comprises carbon-blackened polyethylene PE (with or without a barrier layer), since this easily processed plastic has approximately constant dielectric properties over a wide temperature range and withstands all the mechanical and chemical stresses that typically occur.

25 Marking the cable sheath with numbers, letters, symbols and so forth can be done during extrusion of the sheath, for instance

using a marking wheel. With the aid of the marking wheel, a white plastic powder is applied, in a distribution that corresponds to the desired marking, to the still-hot, carbon-blackened cable sheath. The white powder is fused to the cable
5 sheath by the residual heat that is still present.

Plastics can be marked substantially more quickly and more flexibly by irradiation with a laser probe. See, for instance, Hans-Robert Kohler, "Lasertechnologie und Anwendung" [Laser
10 Technology and Application], Vulkan Verlag, Essen, German, 1993, p. 199-205; and German published patent application DE 31 47 230 A1. Depending on the laser power, the outer plastic layer is locally melted, foamed or evaporated, and its surface or structure varied accordingly.

15 In the irradiated region, a color change occurs, if a pigment admixed with the plastic is selectively destroyed or burned with the aid of a laser probe adapted to a maximum absorption of the pigment. See, for instance, the magazine LASER 4/87, p.
20 34-36; and German patent DE 30 44 722 C2.

In sum, carbon-blackened cable sheaths are typically marked using a marking wheel. Those cable sheaths typically have a high proportion of soot of up to 2.5 ± 0.5 weight % and they
25 are provided with a white, although not very abrasion-proof, marking with the marking wheel. The technique of laser

labeling, which in principle can also be employed, results in removal of material and thus damages the cable sheath.

Moreover, the resultant engraving is only poorly visible, because of the lack of contrast. The substantially more-

5 flexible technique of laser labeling is therefore not currently being used, because the engraving created by removing material can be seen only with difficulty because of the lack of contrast.

10 Summary of the Invention:

The object of the invention is to provide a cable sheathing and to a related method of marking the cable sheathing with photon radiation which overcomes the above-noted deficiencies and disadvantages of the prior art devices and methods of this
15 general kind. The primary object is to provide sheathing that is markable by irradiation with photons, and in particular laser-markable, for instance for elongated or strandlike objects (cable cores of all kinds, in particular cores of current-carrying cables or electrical or optical
20 communications cables). The sheathing should be such that a readily apparent, abrasionproof marking is created on its surface in contactless fashion.

With the above and other objects in view there is provided, in
25 accordance with the invention, a sheathing article, comprising:

a first layer of a first material containing a first proportion of a dye, and bounding an interior;

a second layer adjacent the first layer and bounding an exterior, the second layer having a marking face adapted to be
5 marked by irradiation with photons, and the second layer being formed of a second material and containing, at least inside the marking face, a second proportion of the dye smaller than the first proportion of dye, the second proportion of dye being dimensioned to cause a color change upon irradiation
10 with photons.

In other words, the disadvantages of the prior art are overcome by using the sheathing of the invention as the core casing. Since the comparatively thin outer layer of the
15 sheathing, which has a lesser proportion of soot, completely absorbs the incident laser radiation, the inner layer beneath it that performs the protective function remains intact. The abrasion-proof marking created in the outer layer appears as a white structure against a black background.

20

In accordance with an added feature of the invention, the second material is translucent or transparent for the radiation used for marking.

In accordance with an additional feature of the invention, the second proportion of dye and/or the thickness of the second layer is adjusted such that the second layer completely absorbs the radiation used for marking.

5

In accordance with another feature of the invention, the dye in the first and/or second layers is soot or graphite.

Preferably, the carbon content in the second layer is in a range from 0.2 to 0.8 % by weight, and particularly from 0.2 to 0.5 % by weight, and the thickness of the second layer is in a range from 0.01 to 1.0 mm, particularly from 0.05 to 0.2 mm.

10

15

In accordance with a further feature of the invention, the proportion of the carbon material in the first layer is in a range from 1 to 3 % by weight.

20

In accordance with an advantageous feature of the invention, the first layer and the second layer are formed of the same material. Preferable materials for the layers include thermoplastic and/or viscoelastic materials and an elastomer.

25

In accordance with again a further feature of the invention, the first layer and the second layer are welded, glued, or joined together by an adhesion promoter.

With the above and other objects in view there is furthermore provided, in accordance with the invention, a sheathing which separates an interior from an exterior, and which has an exterior layer:

- 5 the exterior layer is transparent or translucent to a radiation used for marking the exterior layer, and contains a proportion of a dye (soot or graphite); and

10 a dimension of the exterior layer (thickness of the exterior layer and/or the proportion of the dye) is selected such that the exterior layer absorbs the radiation used for marking completely, and a color change results within an irradiated region upon irradiation.

15 The proportion of the dye is preferably at least 0.2 % by weight and at most 0.8 % by weight, and the thickness of the exterior layer is between 0.01 and 1.0 mm, in particular between 0.05 to 0.2 mm.

20 In accordance with a concomitant feature of the invention, the first material, the second material, and/or the material of the exterior layer have stabilizers and/or aging protectants admixed therewith.

Other features which are considered as characteristic for the invention are set forth in the appended claims.

Although the invention is illustrated and described herein as embodied in a sheathing, it is nevertheless not intended to be limited to the details shown, since various modifications and structural changes may be made therein without departing from the spirit of the invention and within the scope and range of equivalents of the claims.

The construction and method of operation of the invention, however, together with additional objects and advantages thereof will be best understood from the following description of specific embodiments when read in connection with the accompanying drawings.

Brief Description of the Drawings:

Fig. 1 is a cross-section taken through a communications cable specifically suited for external applications; and

Fig. 2 is a cross-section of the laser-markable sheath of the outer cable according to the invention.

Description of the Preferred Embodiments:

Referring now to the figures of the drawing in detail and first, particularly, to Fig. 1 thereof, there is seen a core

of a communications cable 1 which comprises a central element 2 (for kink prevention and/or tension relief), made from steel or glass-fiber-reinforced plastic. Stranding elements 3, 4, and 5 are disposed concentrically and coaxially in one layer around the central element 2. A wound wrapping 6 encloses the stranding elements 3, 4, and 5. A composition (petrolatum) that fills the gaps in the core assures that invading water will not spread longitudinally within the cable 1. The cabling elements of the cable core illustrated herein are a so-called copper quad 3, a dummy element 4 made for instance from polyethylene (PE), and three bundle strands 5. Each of the bundle strands 5 comprises a plastic casing and a plurality of optical waveguide fibers 7 disposed in the casing and fixed therein with a thixotropic gel. The tension-absorbing/tension-relieving elements may be suitable aramide fibers and yarns 8. They are disposed between the core wrapping 6 and a black cable sheath 9.

As shown by the cross section in Fig. 2, which is not to scale, the sheath 9 of the communications cable 1 is constructed in layered fashion. The inner layer 10, with a thickness $d = 2$ mm, of the sheath 9 toward the core preferably comprises a carbon-blacked polyethylene, in particular a polyethylene copolymer (polyethylene-ethylene vinyl acetate), whose carbon content is 1 to 3 weight %, and in particular 2.5 ± 0.5 weight %, for instance. An outer layer is only about 0.1

to 1.0 mm thick, and preferably 0.05 to 0.2 mm. The material for the outer layer 11 may be polyethylene (PE), or polypropylene (PP), which adheres well to the polyethylene inner layer 10.

5

The outer sheath layer 11 serving as the marking surface also has soot admixed with it as a dye; the proportion of carbon black is in the range from 0.2 to 0.8 weight %, in particular 0.2 to 0.5 weight %, and preferably in the range from 0.3 to 0.4 weight %. Both sheath layers 10/11, each dyed black, are applied by extrusion to the cable core and welded to one another. If the layers 10/11 acting as the cable sheath 9 are of different materials, then an adhesion promoter or a hot-melt or two-component adhesive serves to bond them solidly.

10

15

To mark the cable sheath 9 with numbers, letters, characters, symbols and so forth, its outer layer 11 is acted upon by electromagnetic radiation at a wavelength of $500 \text{ nm} \leq \lambda \leq 1200 \text{ nm}$. A pulsed Nd:YAG laser, in particular, may be used as a photon source (wavelength: $\lambda = 1064 \text{ nm}$ or frequency-doubled $\lambda = 532 \text{ nm}$; laser power: 90 watts; pulse repetition frequency: 20-50 kHz). The projection system is advantageously a computer-controlled deflector unit and a projecting optical system. In this context, see for instance, the above-mentioned text by Kohler and the German application DE 31 47 230 A1. The

20

25

deflector unit can in particular comprise two mirrors rotatable about orthogonal axes and corresponding driver electronics. The carbon content and the thickness of the outer sheath layer 11 are selected such that this layer completely
5 absorbs the incident laser radiation. Accordingly, the laser radiation does not reach the sheath layer 10 toward the core, and so the mechanical stability and tightness of this layer are preserved.

10 As a consequence of the high energy input, the outer sheath material melts in the region of the laser focus. Since the carbon contained in the soot combusts at the same time to form CO₂, a largely soot-free, foamlike structured region is created, which very markedly scatters incident light. The
15 region of the outer sheath layer 11 scanned with the laser probe thus looks like a white surface on a black background.

It will be readily understood that the exemplary embodiment described in the foregoing should in no way limit the scope of
20 the invention. The inventive concept, by way of example, also encompasses the following and additional applications:

- to sheath the core of an electrical communications or current-carrying cable, coaxial cable, strand having an electric conductor, optical waveguide strand, or optical
25 waveguide bundle strands, in the manner described, in which

case the inner layer of the sheathing need not necessarily contain soot or graphite (naturally colored material);

- to embody the inner layer of the sheathing in layered form;

- to coat a cable sheath, coaxial cable or strand with a material that adheres well, and that contains the aforementioned proportion of soot or graphite, and then to mark the material by irradiation with photons;

- to provide the sheathing with tension-relieving and/or tension- absorbing elements (aramide yarns, steel wires, etc.);

- to use the sheathing as a hose or tube (water hose, pipe for floor heating, and so forth), in which the inner layer of the suitably dimensioned, adequately thick sheathing need not necessarily contain soot or graphite;

- instead of the high, medium or low density polyethylene (HDPE, MDPE, LDPE) or polypropylene, to use another plastic which is transparent or at least translucent to radiation at the wavelength of $500 \text{ nm} \leq \lambda \leq 1200 \text{ nm}$;

- to use PVC (polyvinyl chloride), PA (polyamide), FEP (fluorinated ethylene-propylene copolymer), PFA (perfluoroalkoxy copolymer) or EVA (ethylene vinyl acetate) as the sheath material;

- to mix stabilizers and aging protectants (antioxidants, light protection agents, UV absorbers, and so forth) in with the sheath materials;
 - to sheathe even non-elongated or non-strandlike objects in the manner described, or to provide them with a plastic layer having the aforementioned soot/graphite content and then mark them by irradiation with photons.
- 5

We claim:

1. A sheathing article, comprising:

a first layer of a first material containing a first proportion of a dye, and bounding an interior;

a second layer adjacent said first layer and bounding an exterior, said second layer having a marking face adapted to be marked by irradiation with photons, and said second layer being formed of a second material and containing, at least inside said marking face, a second proportion of the dye smaller than said first proportion of dye, said second proportion of dye being dimensioned to cause a color change upon irradiation with photons.

2. The sheathing according to claim 1, wherein said second material is one of translucent and transparent for the radiation used for marking.

3. The sheathing according to claim 1, wherein at least one dimension selected from the group consisting of said second proportion of dye and a thickness of said second layer is adjusted such that said second layer completely absorbs the radiation used for marking.

4. The sheathing according to claim 1, wherein said dye in said first and second layers is carbon material selected from the group consisting of soot and graphite.
5. The sheathing according to claim 4, wherein the proportion of said carbon material in said second layer is in a range from 0.2 to 0.8 % by weight.
6. The sheathing according to claim 4, wherein the proportion of said carbon material in said second layer is in a range from 0.2 to 0.5 % by weight.
7. The sheathing according to claim 3, wherein the thickness of said second layer is in a range from 0.01 to 1.0 mm.
8. The sheathing according to claim 7, wherein the thickness of said second layer is in a range from 0.05 to 0.2 mm.
9. The sheathing according to claim 4, wherein the proportion of said carbon material in said first layer is in a range from 1 to 3 % by weight.
10. The sheathing according to claim 1, wherein said first layer and said second layer are formed of the same material.

11. The sheathing according to claim 1, wherein at least one of said first layer and said second layer are formed of a synthetic material selected from the group consisting of thermoplastic material, viscoelastic material, and an elastomer.

12. The sheathing according to claim 1, wherein said first layer and said second layer are one of welded, glued, and joined together by an adhesion promoter.

13. A sheathing article, comprising:

a sheathing separating an interior from an exterior, and having an exterior layer;

said exterior layer being transparent to a radiation used for marking said exterior layer, and containing a proportion of a dye selected from the group consisting of soot and graphite; and

a dimension of said exterior layer selected from the group consisting of a thickness of the exterior layer and the proportion of said dye being selected such that said exterior layer absorbs the radiation used for marking completely, and a color change results within an irradiated region upon irradiation.

14. The sheathing article according to claim 13, wherein said exterior layer is translucent to the radiation used for the marking.

15. The sheathing article according to claim 13, wherein the proportion of the dye is at least 0.2 % by weight and at most 0.8 % by weight.

16. The sheathing according to claims 13, wherein the thickness of said exterior layer is between 0.01 and 1.0 mm.

17. The sheathing according to claims 13, wherein the thickness of said exterior layer is between 0.05 to 0.2 mm.

18. The sheathing according to claim 13, wherein said exterior layer is formed of a synthetic material selected from the group consisting of thermoplastic material, viscoelastic material, and an elastomer.

19. The sheathing according to claim 13, wherein said exterior layer has materials selected from the group consisting of stabilizers and aging protectants admixed therewith.

20. The sheathing according to claim 1, wherein at least one of said first and second materials selected from the group

consisting of stabilizers and aging protectants admixed therewith.

**COMBINED DECLARATION AND POWER OF ATTORNEY
IN ORIGINAL APPLICATION**

As a below named inventor, I hereby declare that: my residence, post office address and citizenship are as stated below next to my name; that I verily believe that I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

LASER-MARKABLE SHEATHING

described and claimed in the specification bearing that title, that I understand the content of the specification, that I do not know and do not believe the same was ever known or used in the United States of America before my or our invention thereof, or patented or described in any printed publication in any country before my or our invention thereof or more than one year prior to this application, that the same was not in public use or on sale in the United States of America more than one year prior to this application, that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representatives or assigns more than twelve month prior to this application, that I acknowledge my duty to disclose information of which I am aware which is material to the examination of this application under 37 C.F.R. 1.56a, and that no application for patent or inventor's certificate of this invention has been filed earlier than the following in any country foreign to the United States prior to this application by me or my legal representatives or assigns:

German Application No. 198 12 314.0, filed March 20, 1998, the International Priority of which is claimed under 35 U.S.C. §119; and International Application No. PCT/DE99/00818, filed March 19, 1999, the Priority of which is claimed under 35 U.S.C. §120.

I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith:

HERBERT L. LERNER (Reg.No.20,435)
LAURENCE A. GREENBERG (Reg.No.29,308)

Abstract of the Disclosure:

The laser-markable sheathing comprises a carbon-blackened inner PE layer with a soot proportion of 2.5 ± 0.5 % by weight and an outer PE layer 0.05 to 0.2 mm thick. The outer PE layer
5 completely absorbs the laser radiation ($\lambda = 532$ nm) used for the marking, and the inner layer beneath it remains intact. A largely carbon-free, foamlike structure which greatly scatters incident light serves as an abrasion-proof marking. The sheathing is suitable for cable cores, fiber-optic cable
10 strands, and the like.
